

Compliance platform. Inside-out assessment.

EIT Community AI Entrepreneurs Lab 2026 | Simone Mattioli and Andreas Herzinger

We assess compliance from inside your own systems and prepare it for real lawyers, so companies spend less on legal work and more on competing.

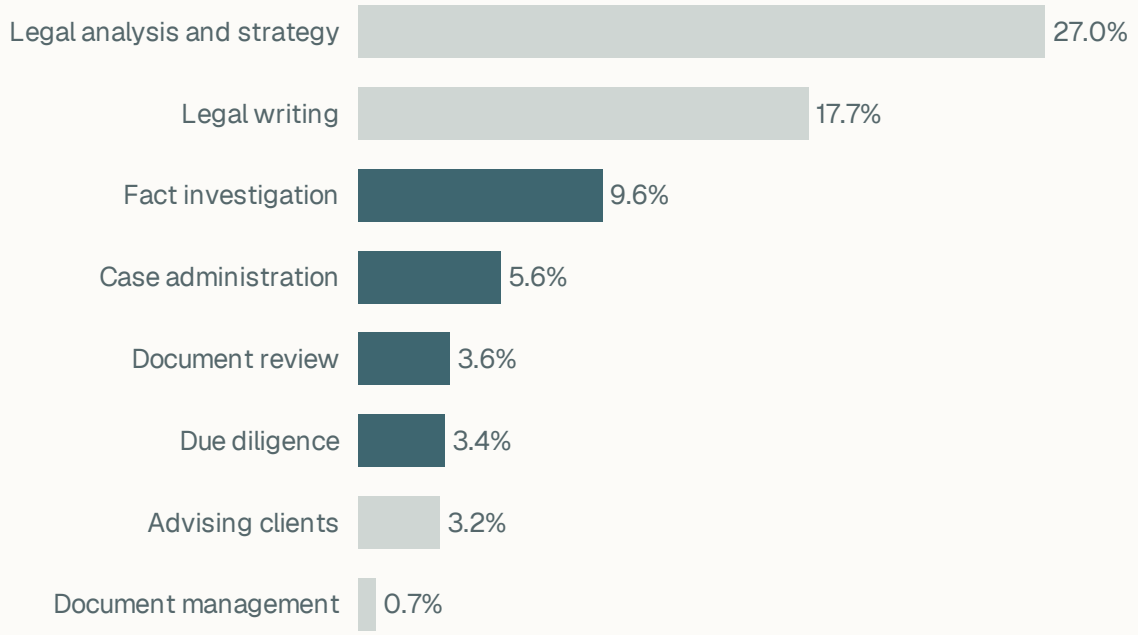

A fifth of every legal bill buys facts, not advice

19 to 23%

of lawyers' invoiced hours go to fact-finding tasks, before any judgement is given. In a first compliance review of a software company the share is higher: the lawyer has to learn the whole setup first.

- Before anyone can advise on GDPR, NIS2 or the AI Act, someone must establish what the company actually runs: systems, vendors, data flows, models. Law firms bill that by the hour.
- AI assistants make the lawyer about 20% faster at the same task. They do not remove the task.
- Small companies feel it most: 34% of NIS2-covered entities say they cannot obtain the extra budget, a share that is highest for SMEs.

Share of invoiced hours by task, US firms with fewer than 1,000 lawyers

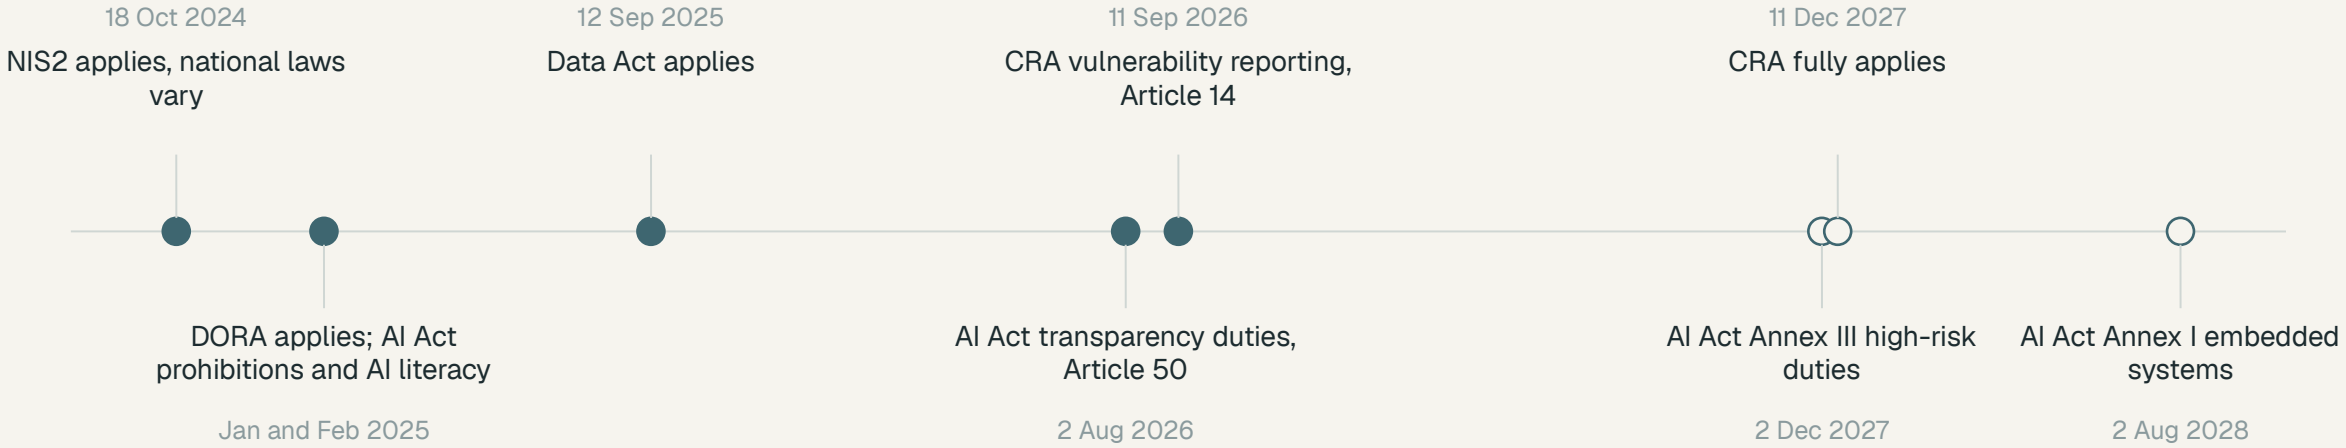

Teal bars are fact-finding. Together about 23% of the bill.

Sources: Remus and Levy, Can Robots Be Lawyers?, Georgetown Journal of Legal Ethics 30 (2017), Table 1, Sky Analytics billing data. Schwarcz et al., AI-Powered Lawyering, 2025. ENISA NIS Investments 2024, p. 46.

Dates read on EUR-Lex, 18 October 2026

Five EU laws in four years. Budgets cannot keep up

Each law brings its own evidence duties and the deadlines overlap. A software company selling to regulated customers meets most of them through procurement questionnaires, long before a regulator calls.

Filled dots: in force today. Open dots: still ahead. GDPR has applied since May 2018 and sits under all of it.

+12.5%

security spending growth in 2026, to $240 bn (Gartner)

11% a year

growth of GRC software spending to 2029, to $9.08 bn (Verdantix)

€140 bn

turnover of legal activities in the EU-27 in 2022 (Eurostat)

25 to 35%

cut in reporting burden the Commission targets for companies and SMEs

Others ask. We read

Every incumbent asks the company what it does: forms, interviews, questionnaires. Regulift connects to the systems themselves with read-only access and reads what the company actually runs.

The usual way: outside-in

- ○ Forms and interviews that rely on memory
- ○ A snapshot that is out of date the week after
- ○ Billable hours spent collecting facts, not giving advice
- ○ Evidence assembled by hand before every review

The Regulift way: inside-out

- ● Connects to repositories, cloud, HR and CRM tools, read-only
- ● Builds the data and AI inventory from real flows, not recollection
- ● Stays current as the systems change
- ● Hands lawyers evidence, so their hours go to judgement

Read-only, by design

We never change your systems. Access can be revoked at any time.

Hosted in Europe

Materials and findings stay on European infrastructure, under European law.

Real lawyers, when it matters

Partner law firms work inside the platform. Advice comes from a lawyer, never from a model.

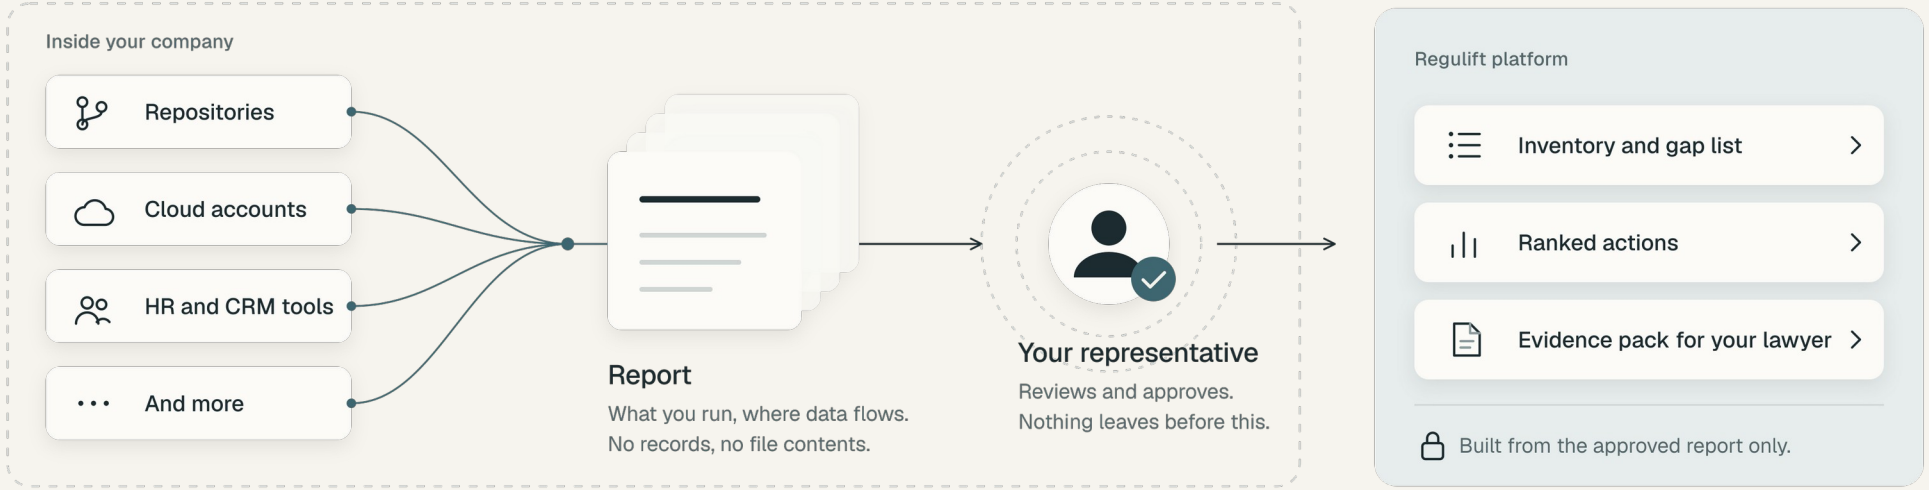

You own the record

Export the inventory and evidence at any time. No lock-in.

Design principles of the platform as published on the Regulift website, section Inside-out, October 2026.

Context leaves. The data stays

A collector reads inside the company and writes a report about what runs and where data flows, never the records themselves. One named representative approves it. Only then does it reach the platform.

01 Understand

Regulift maps data flows, AI use and third parties from the approved report and builds the context for an assessment that fits the business.

02 Improve

Every missing piece of evidence becomes a ranked action. Most close without a lawyer: a processing agreement, a retention schedule, an incident playbook.

03 Review

Partner lawyers open the same workspace, with inventory, evidence and open items in place, and confirm compliance in writing.

Diagram from the Regulift website. The approval step is a product rule, not an option. No records, no file contents, no credentials leave the company.

AI does the groundwork. People make the call

The AI is not a chat window on top of a checklist. Without agents that read systems at scale there is no inside-out product. A deterministic layer written by lawyers keeps it on the right side of the law.

Layer 1, deterministic

Lawyer-authored applicability trees

Partner law firms write the yes-or-no logic that decides which obligations apply: headcount, sector, role, data categories. Mechanical rules of this kind are what the German Federal Court protected in the Smartlaw ruling, so the platform never gives an individual legal opinion itself.

Layer 2, agentic

A collector that reads systems through MCP

Agents connect to repositories, cloud accounts, HR and CRM tools through Model Context Protocol servers with read-only scopes. They identify services, models, processors and data flows and write the context report the representative approves. No questionnaire can do this.

On top

Architecture-to-law mapping and evidence graph

Language models map the approved report onto obligations: which flow is a transfer, which model decides about people, which service is a supplier under NIS2 or DORA. Every finding links to its evidence. Grey-zone questions route to the partner lawyer, never to an autogenerated verdict.

What compounds

- An evidence graph per company that grows with every connector and every review
- A rule base per jurisdiction, authored and signed by partner firms under their own name
- A network of law firms that refer clients because the platform sends them better work

Every incumbent asks the company. None reads it

What you get	Regulift	Compliance consultancies	Questionnaire platforms	AI governance tools
	inside-out, lawyers inside	DataGuard, heyData, Secjur	OneTrust, Vanta, Drata	Credo AI, Holistic AI, trail
Starts from your real systems, not a form	●	○	○	◐
GDPR, AI Act, NIS2 and DORA in one view	●	◐	◐	○
Lawyer review built into the journey	●	●	○	○
Stays current after the first assessment	●	○	◐	●
Built to lower your legal bill	●	○	◐	○

● Yes ◐ Partly, or at extra cost ○ Not the focus. Twelve vendors reviewed. Closest single players: Justima (law-firm-backed monitoring), Norm Ai (US finance only).

Who we build for first

B2B software and SaaS companies and managed IT providers with 20 to 249 staff. They sell to regulated customers, run on cloud and code we can read, and rarely have a compliance department.

23,370

EU software firms with 20 to 249 staff (Eurostat, NACE J62, 2024)

119,784

enterprises with 50 or more staff in Austria, Germany and Italy, our first three markets

USD 20,000

median yearly spend on Vanta, usually for one framework (Vendr, 374 purchases)

Sources: Regulift market scan of public product pages and funding announcements, 14 Oct 2026. Eurostat sbs_sc_ovw 2024. Vendr marketplace data, Feb 2026. Vendor names are examples per category.

Three laws, one country, one channel

Start where the evidence says the pain is, with a structure that is lawful in every market we plan to enter.

Which laws first

GDPR, NIS2, AI Act

- GDPR applies to every company that handles personal data; the inventory comes straight from the collector
- NIS2 reaches small suppliers through their customers: 63% of covered organisations require security standards from suppliers
- AI Act high-risk duties apply from 2 Dec 2027, so the inventory work starts now
- Next, in this order: CRA, DORA as a supplier module, Data Act for SaaS. CSRD dropped

Which country first

Austria, then Germany, then Italy

- Austria: NIS2 law in force since 1 Oct 2026, registration due within three months, the freshest trigger of any candidate
- 861 firms with 50 or more staff per million inhabitants against an EU average of 680; legal spend about €441 per head a year
- One founder is Austrian; Vienna is under three hours from Budapest, where pilots start
- Germany is the biggest prize (80,043 firms with 50 or more staff); Italy adds a native-speaking founder

Through whom

Partner law firms

- Firms refer clients because the evidence pack removes the hours clients resent and leaves the advisory hours they value
- A partner firm authors the rules for its jurisdiction, reviews inside the platform and confirms compliance in writing
- The firm pays a flat yearly workspace fee, never a share of fees or a fee per mandate, which bar rules forbid in DE, AT, IT and FR
- The client picks the firm from a list and is billed by the firm directly

Sources: NIS2 Art. 2(1) and 21(2)(d); ENISA NIS Investments 2025, p. 26. RIS, BGBl. I Nr. 94/2025 (NISG 2026). Eurostat sbs_sc_ovw 2024, nama_10_co3_p3. BRAO §49b(3), BGH IX ZR 89/23, ÖRAK RL-BA §47(3), Italian CDF art. 37, French RIN art. 11.3. Full scoring of 15 countries in the research reports.

Platform, modules, and lawyers who bill their own work

Platform base, GDPR included

€3,600 to €14,400

per year, by company size

Three bands: 10 to 49 staff €3,600, 50 to 249 staff €7,200, 250 to 1,000 staff €14,400. Read-only connectors, context report, inventory and the GDPR module.

Regulation modules

€1,800 to €6,000

per regulation per year, by size

AI Act, NIS2 readiness, DORA for ICT suppliers, CRA. Each adds its gap list and evidence pack. A mid-sized company with three modules lands at €14,400 to €18,000 a year.

Partner law firms

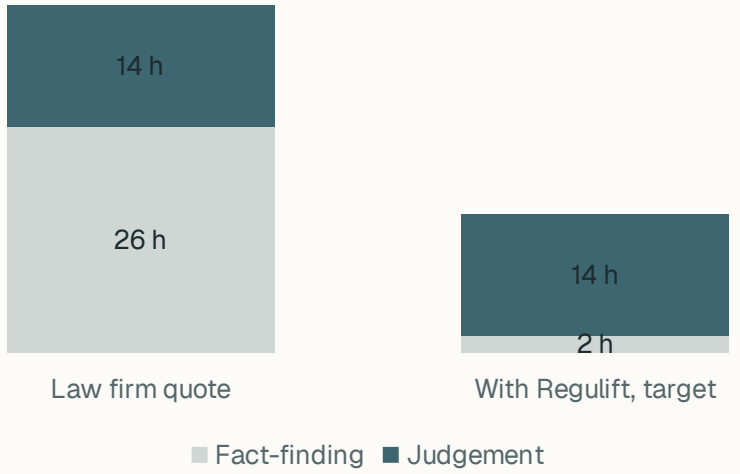

Flat yearly fee

same for every firm, never per mandate

The firm bills its legal work directly to the client. Regulift takes no share and no fee per mandate or lead.

Lawyer hours in our illustrative case

Forty hours quoted, sixteen as our target. Labelled a target until pilots are measured.

Target: a legal bill about 60% lower for a readiness review. Published trials measure about 20% when the lawyer keeps doing the discovery. We remove the discovery before the clock starts.

Sources: Vendr, Feb 2026. Vanta and Drata AWS Marketplace listings, Oct 2026. StartComply pricing, Oct 2026. BRAK STAR survey 2024 (€244 an hour average German rate). Schwarcz et al. 2025. Clio Legal Trends 2024. Tier prices are our proposal within the researched ranges; the 40-hour split is an assumption.

Plan.
30, 60, 90 days, then the first year.

Honest stage: concept with a validated design

How we really build this

Live	Designed	Researched	Not yet
Name, positioning and website with the inside-out model, data-flow design, comparison and FAQ	Collector architecture: read-only MCP connectors, context report, approval step, evidence graph	Twelve-vendor scan, source-checked figures, regulation, country and pricing decisions	No customers and no signed law firm. The plan below is built to change that

Days 1 to 30, the bootcamp weeks

Prove the pain

- 15 discovery interviews with CTOs and founders of 50 to 250 person software companies in Austria and Budapest
- Letter of intent from one Vienna law firm, model reviewed against Austrian bar rules
- Collector prototype: GitHub and one cloud provider, read-only, context report generated

Days 31 to 60

Prove the flow

- Two design partners connect real systems
- Representative approval and report sync working end to end
- First inventory and gap list reviewed by the partner firm

Days 61 to 90

Prove the value

- First evidence pack confirmed in writing by the partner firm
- Measured lawyer hours against the firm's own quote
- Pricing tested with both design partners; company incorporated

Months 4 to 12

Scale the loop

- HR and CRM connectors; NIS2 and AI Act modules live on top of GDPR
- Ten paying pilots in Austria, second law firm signed, aws Preseed application
- Germany opened through a partner firm; pre-seed round on measured pilot data

Each block ends with evidence a jury can check: an interview count, a signed letter, a working connector, a paying pilot.

Two founders, one problem we have both touched

Simone Mattioli

Co-founder. Customers, partners, programme

EIT Digital Master School, Autonomous Systems and Intelligent Robotics track. Leads discovery, partner law firms and the application.

Andreas Herzinger

Co-founder. Product and engineering

EIT Digital Master School, Data Science. Freelance AI engineer: SME integrations, MCP servers, secure LLM data connections, RAG in production.

Why us

The problem found us through Andreas's integration work: every SME project started with the same unanswered compliance questions, and every answer cost a lawyer's hours. The collector is the kind of system he already builds. Simone runs discovery and partners.

What we ask for

A place in the cohort. One week to test the inside-out model with customers, mentors and investors, and to meet partner law firms through the programme's network.

What the €10,000 award would buy

The legal review budget of the first two pilots, so a partner firm's hours are paid and the hour reduction is measured, plus the second and third collector connectors.

What you can check today

The live website, the source behind every number in this deck, and the research reports on regulations, countries and pricing.
